

ABSTRACT OF THE DISCLOSURE

65	A network-infrastructure cache ("NI Cache") transparently
	provides proxy file services to a plurality of client workstations
	concurrently requesting access to file data stored on a server.
	The NI Cache includes a network interface that connects to a
	digital computer network. A file-request service-module of the NI
70	Cache receives and responds to network-file-services-protocol
	requests from workstations through the network interface. A cache,
	also included in the NI Cache, stores data that is transmitted back
C. C.	to the workstations. A file-request generation-module, also
	included in the NI Cache, transmits requests for data to the
7 - 5	server, and receives responses from the server that include data
	missing from the cache.
